Summary

Full stack developer, working mainly on the frontend (React, TypeScript) with backend knowledge, covering the full cycle of web applications. 6th-semester student of Multiplatform Software Development at Fatec Jacareí. I have hands-on experience with microservices and micro frontend architectures (Module Federation), REST API integration and consumption, version control with Git, containers with Docker, automated testing and CI/CD pipelines. I am proactive in identifying and solving problems beyond the scope of the tasks assigned to me, with a consistent record of approved deliveries without rework.

Experience

InCicle — Development Intern (05/2026 – present)

Frontend development of multiple product modules (OKR, Hiring/Onboarding, DISC, Agenda, Thermometer, among others), working in a micro frontend architecture.

- Responsible for the OKR module, including development of features such as Gantt visualization and validation of business rules directly with technical leadership.
- Development of frontend features with React and TypeScript, from planning to production deployment, with a high rate of approval straight in QA (no rework).
- Proactive identification and fixing of critical bugs in production and staging, including module outages caused by version conflicts in Module Federation, deploy regressions and internationalization (i18n) issues in third-party modules, often on my own initiative and outside the scope of the assigned tasks.
- Review of squad teammates' Pull Requests, contributing to the team's code quality.
- Execution of (functional) QA tests on my own and other people's tasks, including full rounds of preventive QA that generated dozens of fix tasks before release to customers.
- Implementation and maintenance of the AI agent configuration (ai-core) across multiple team repositories (backend and frontend), including a version update with Gitflow standardization and fixing incompatibilities between different adapters.
- Resolution of urgent hotfixes on direct request, with autonomy from analysis to fix in production, recognized by the team as a reference for reporting and resolving bugs.
- Participation in visual standardization initiatives (dark mode / design system) using a component library shared across the frontends.

Poliedro Educação — Educational Assistant (Young Apprentice Program) (06/2024 – 04/2026)

Responsible for managing and controlling class absences, with periodic follow-up and submission of this information. Student support, help with resolving questions and formatting/organizing class materials on teachers' request, in addition to support for the general activities of the pedagogical department.

Education

Fatec – Faculdade de Tecnologia do Estado de São Paulo (2023 – 2027) — In progress, 6th semester
Technologist Degree in Multiplatform Software Development — expected completion in 2027

Solid knowledge of TypeScript and frameworks such as React, with experience in SQL and NoSQL databases, consuming and integrating internal and external APIs, object-oriented programming and good code organization practices (including automated testing). Development of academic projects and projects in partnership with companies using the Scrum agile methodology.

Etec – Escola Técnica Estadual (2020 – 2022)
Systems Development Technician

Technical course integrated with high school, with the first hands-on contact with the technology field: HTML, CSS, JavaScript, fundamental concepts, agile methodologies, databases and data relationships. Final course project developed with the Scrum methodology, using JavaScript and PHP.

Featured projects

Player Profile Clustering — Machine Learning model (K-Means) that classifies soccer athletes into physical performance profiles from session metrics, served through a Node.js API with ONNX Runtime.

MNIST Classifier — Application that recognizes handwritten digits drawn by the user, using a neural network trained on the MNIST dataset (Keras/TensorFlow), with a Node.js backend and a Python/FastAPI inference service.

Maps — Flight route simulator between two points in Brazil, randomly drawn or chosen by the user, calculating the real path with the Earth's curvature and geographic data through the IBGE API.

Full portfolio with more projects, code and technical details available on the website.

Certificates

- Expro – Future Managers (2024 – 2026)
- Computing Teaching Assistance – 200 hours
- Robotics Teaching Assistance – 200 hours

Technical skills

Languages & Frontend: JavaScript, TypeScript, React, HTML5, CSS3
Backend & APIs: Node.js, Express, REST APIs, API consumption and integration
Data & AI: SQL, PostgreSQL, MongoDB/NoSQL, Python, scikit-learn, ONNX, data modeling
Architecture: Microservices, Micro Frontends (Module Federation), Object-Oriented Programming, Clean Code
DevOps & Tools: Docker, Git, GitHub, CI/CD, Unit and automated testing
Cloud & Infrastructure: AWS, Linux (command line), cloud environments
Methodologies: Scrum, Kanban, Agile Methodologies
Other: JWT, Debugging, Problem Solving, Technical Documentation, AI applied to development
